                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.

products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 AAAGACGTATTGCCCAATGGGGATGGGACCTACCAGGGCTGGATAACCTTGGCTGTACCC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.

                                                                                                                                                                                                                                                The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a 1-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cDNA sequence encoding a histocompatibility iron loading (HFE) protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence encodes a human histocompatibility iron loading (HFE) protein. The HFE gene is a major histocompatibility (MFC) non-classical class I gene located or chromosome 6p. Mutations in the gene lead to iron disorders. The specification describes a method for diagnosing an iron disorder or a genetic susceptibility to develop the disorder in a mammal. The method comprises determining the presence of a mutation in exon 2 or an intron of a HFE gene or protein. The mutation is not a C to G missense mutation at nucleotide 187 of the sequence given in A96769 (Genbank Accession number 166119). The presence of the mutation indicates the disorder or the genetic susceptibility to the disorder. The method is used to diagnose an iron disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Diagnosing an iron disorder e.g. hemochromatosis or a genetic susceptibility to develop it, by determining the presence of a mutation in exon 2 or an intron of a histocompatibility iron loading nucleic acid -

This sequence represents the haemochromatosis (HC) gene. Mutations in this sequence are detected using the method of the invention. The method is for identifying an individual with hereditary haemochromatosis (HH) or a predisposition to develop HH or to genetically pass on HH to an offspring, comprising isolating a biological sample and amplifying a region of genomic DNA in the biological sample encompassing all or part of the DNA between markers D6S265 and D6S276, and detecting at least one homozygous or heterozygous mutation in a nucleotide within the region. The method can also be used for identifying an individual with an cutosomal recessive disorder (ARD) or predisposition to develop and/or genetically pass on an ARD to an offspring, comprises isolating a biological sample from the individual and screening genomic DNA in the sample for the presence of a homozygous or heterozygous (carriers) for the disorder. The method(s) can be used to identify individuals that are homozygous or heterozygous (carriers) for the mutation in a can be used to didentify individuals that are homozygous or heterozygous (carriers) for the mutation causing the ARD. Especially the method is used to diagnose HH or predisposition to HH by detecting a Cya282Tyr substitution. Individuals homozygous for this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            o;

The invention relates to novel genes (AAL34669-AAL37666) and proteins (ABB03087-ABB04109) associated with the musculoskeletal system useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human crissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, cher cancers of the adlesse, allergies, autoimmune hamolytic disorders e.g. Addison's disease, allergies, autoimmune hamolytic anaemia, autoimmune thyroidities, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; conditions autoimmune thyroiditis, diabetes mellitus, Crohn's disease, and (f) infectious diseases such as myocardial ischaemias; (d) wound parasitic infections.

Constant of infections diseases such as viral, bacterial, fungal and parasitic infections.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.WiPO int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1748 AAAGACGTATTGCCCAATGGGGATGGGACCTACCAGGGCTGGATAACCTTGGCTGTACC 1807

The invention describes an isolated nucleic acid molecule comprising a sequence encoding musculoskeletal system associated polypeptides useful for detecting disorders, e.g., cancer or cancer metabatases, in animals or human. The nucleic acid: srimulates re-vascularisation of isohaemic tissues associated with conditions such as thrombosis, arteriosclerosis, and other cardiovascular conditions; treats wounds due to injuries.

CC burns, post-operative tissue repair, and ulcers; stimulates angiogenesis and limb regeneration; stimulates neuronal growth; can treat and prevent neuronal damage occurring in certain disorders or neurodegenerative conditions, such as, Alzheimer's disease, Parkinson's disease, and ALDS-related complex; stimulates chondrocyte growth, thus they can be used to enhance bone and periodontal regeneration and aid in tissue continuous probably and adding strate and prometry stimulating keratinocyte growth; prevents kin aging due to sumburn by stimulating keratinocyte growth; prevents hair loss; since FGF family members activate hair-forming cells and promotes melanocyte growth, members activate hair-forming cells and promotes melanocyte growth, members activate hair-forming cells and promotes melanocyte growth, companient of merodecement of primary or grapes before transplantation of for supporting cells and bone marrow cells when used in combination with other cytokines; maintains or grapes before transplantation of mesodermal origin to differentiate of primary or grapes promote melance for pair, colour, skin, percentage of adipose tissue of pignentation, size, and shape (e.g., cosmetic surgery) involutes mammalian metabolism; changes mammalian sentel state or physical state by influencing blorthyms, creproductive capabilities, hormonal or endocrine levels, appetite, creproductive capabilities, hormonal or endocrine levels, appetite, creproductive capabilities, hormonal or endocrine levels, appetite, content, lipid, protein, carbohydrate, vitamins, mineral system antigen.

Hereditary haemochromatosis gene and variants - useful for diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This genomic DNA sequence corresponds to the human gene whose mutated form is associated with hereditary hemochromatosis (HH). To identify this novel gene, allelic association patterns were determined between known markers and the HH locus in the HLA region of chromosome 6. A physical clone coverage was then generated extending from D65255, which is a marker that is centromeric of HLA-A, in a telomeric direction through D65276, a marker at which the allelic association was no longer observed. A single mutation (24d) in the HH gene appears responsible for the majority of HH disease. This comprises a G to A substitution that is present in 86% of affected chromosomes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           i
"G to A substitution (24d1 mutation
associated with HH), results in Cys to
Tyr substitution"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g

It results in a cys to Tyr substitution in the encoded protein (see AAM36499) at a critical disulphide bridge important for secondary structure. The following are claimed: the HH genomic DNA [1], a 1437 bp CDNA sequence [1a] (see AAT96691) and their 24d1, 24d2 and 24d7 variants; a cloning or expression vector; host cells; a peptide product chosen from the HH gene product, its variants captide product chosen from the HH gene product, its variants (24d1, 24d2 and 24d7), or a peptide of at least 56 amino acid residues of these; an antibody produced using the peptide; a method to determine the presence or absence of the common HH gene mutation; an animal model for the HH disease; metal chelation capents. T-cell differentiation factors and therapeutic agents for the mitigation of injury due to oxidative process in vivo or mitigation of injury due to oxidative process in vivo or mitigation of inconverload; a method for screening potential. Cherapeutic agents for activity in connection with HH disease; an antisense oligonucleotide directed against a transcriptional product of a nucleic acid sequence as above; and oligonucleotides covering a range of nucleotides from (1), (1a) or their variants, useful for detecting a polymorphism in the HH gene. The invention also relates to methods for screening and the invention also relates to methods for screening and the invention also relates to methods for screening and

The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.
                                                                 New hereditary hemochromatosis gene products or polypeptides, useful for treating hereditary hemochromatosis in a patient, and as a metal chelation agent alleviating iron overload -
                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/652,265
FILLING DATE: 23-MAY-1996
CLASSTETATION: 514
ATTORNEY/AGENT INFORMATION:
NAMME: SMILL, WIlliam M.
REGISTRATION NUMBER: 17957-000500
TELEBRACE/DOCKET NUMBER: 17957-000500
TELEBRACE ATTON INFORMATION:
TELECOMMONICATION INFORMATION:
TELECOMMONICATION INO: 9:
SEQUENCE (415) 576-0200
INFORMATION FOR SEQ ID NO: 9:
SEQUENCE CHARACTERISTICS:
LENGTH: 1440 base pairs
TYPE: nucleic acid
TYPE: nucleic acid
TYPE: nucleic acid
TYPE: nucleic acid
TYPE: LENGTH: linear
MOLECULE TYPE: CDNA
                                       APPLICANT: Feder, John N.
APPLICANT: Gnirke, Andreas
APPLICANT: Ruddy, David
APPLICANT: Tsuchihashi, Zenta
APPLICANT: Wolff, Roger K.
TITLE OF INVENTION: Hereditary Hemochromatosis Gene
NUMBER OF SEQUENCES: 44
CORRESPONDENCE ADDRESS:

/note="Organ: Stomach; Vector: pME18-FL3; Site_l: XhoI;
/note="Organ: Stomach; Vector: pME18-FL3; Site_l: XhoI;
Site_2: XhoI; The poly (A) + RNA was dephosphorylated with bacterial alkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped intact mRNA was ligated with DNA-RNA linker including Sfil site by treatment of T4 RNA ligase and the first strand cDNA was synthesized with Supersoript II using Sfil oligo-dT primer. After first strand synthesis, RNA was degraded by NoOH treatment and cDNA was amplified by PCR reaction. The PCR products were digested with Sil and cloned into DraIII - digested pME188-FL3 vector. The obtained cDNA vectors were used for transformation of competent cells E. coli ToplOF' by electroporation method. The cDNA libraries constructed by this method are full-length enriched cDNA library."

polylinker; Site l: Not I; Site 2: Eco Ri; The
NIH BMAP Ret4 52 library is a subtracted library,
ultimately derived from mouse retina tissue libraries at
various stages of development. For a detailed description
of the library from which this clone was derived, please
visit our web site at brainest.eng.uiowa.edu. The tissue
for this library was contributed by Dr. Xin-Yuan Fu, Yale
University School of Medicine

CDNA Library Preparation: M.B. Soares Lab Clone distribution: Researchers may obtain BMAP CDNA clones from RESEARCH GENETICS. It should be noted that Bento Soares is generating a small number of additional specialized non-redundant arrays of BMAP CDNAs whose availability will be considered under appropriate and limited collaborative arrangements The tissue for this library was contributed by Dr. Xin-Yuan Fu, Yale University School of Medicine The following repetitive elements were found in this CDNA sequence: 1-31, >(CAG
